

Radio Direction Finding (RDF)/Fox Hunting

What is "Fox Hunting" or Radio Direction Finding (RDF)?

- Radio Direction Finding is a way to find a hidden radio transmitter
- It's like Geocaching with a radio

Why do we do it?

- As with many things in amateur radio it is a way to practice
 - useful skills
- It's used to rescue lost or injured people
- It's used to track wildlife
- It's used to track down a station not following the FCC rules
- There are RDF competitions to encourage skill development
- It's fun!

Fox Hunting Gear

What's Needed?

- An inexpensive hand-held radio
 - · Receive only, no license needed
 - A dual-band radio is best
 - A signal strength meter is helpful
- An antenna
 - Rubber Duck that comes with the radio is OK to start with
 - A directional antenna can help
- A means to make the signal weaker when you get close
 - Small directional antenna
 - Loop antenna NULL is through open side of loop
 - A Rubber Duck antenna
 - Tune radio to 3X Fox frequency or off frequency

Radio Direction Finding (RDF)/Fox Hunting

What am I Trying to Find?

Radio Direction Finding (RDF)/Fox Hunting

Fox Examples

Example: N1FD fox frequencies:

- N1FD/Fox 0 146.595 MHz (.5 Watts)
- N1FD/Fox 1 146.000 MHz (15 mW)
- N1FD/Fox 2 146.000 MHz (15 mW)

Locating the Fox

Begin by taking some Bearings, then Triangulate...

Locating the Fox

How do you take a bearing?

 Best accuracy comes from finding the direction where the fox is weakest – it will be located in the opposite direction

- Even better is to find a range of directions where you can't hear it, pick the center, and turn 180°
- Open the radio Squelch and use the radio's signal strength meter
- How do you make the fox sound weaker?
 - Use a directional antenna (Yagi, Loop, or a Rubber Duck)
 - Change the orientation of your antenna (vertical to horizontal)
 - Use your body as a signal block
 - Tune your radio off frequency a bit in +/- 5kHz steps
 - Tune your radio to 3X the Fox frequency (the third Harmonic) –
 Example: 146.595 MHz Fox x 3 = 439.785 MHz
 - Your strength meter on your HT can be very helpful with this!
 - Some combination of these will usually work

Some Final Tips

- Try working as a team
 - Two heads are better than one...
 - Its more fun!
- Take bearing from high places
- Use your radio's signal strength meter
- Beware of reflected signals
 - Does your latest bearing make no sense?
 - Bridges, buildings, etc. will reflect signals, giving incorrect headings
 - Did the Fox appear to change location by itself?
 - Try moving to a different spot and take another bearing to confirm you reading...
- When you get close, it may be best to put the radio down and just look hard for the Fox's final hiding place....

Let's Go Fox Hunting!!
